In the early 1960s Wilt Chamberlain was one of only three players in the National Basketball Association (NBA) listed at over seven feet. If he had played last season, however, he would have been one of 42. The bodies playing major professional sports) have changed dramatically over the years, and managers have been more than willing to adjust team uniforms to fit the growing numbers of bigger, longer frames.

The trend in sports, though, may be obscuring an unrecognized reality:

Americans have generally stopped growing. Though typically about two inches

taller now than 140 years ago, today's people — especially those born to families

who have lived in the U.S. for many generations — apparently reached their limit

in the early 1960s. And they aren't likely to get any taller. "In the general

population today, at this genetic, environmental level, we've pretty much gone as

far as we can go," says anthropologist William Cameron Chumlea of Wright

State University. In the case of NBA players, their increase in height appears to

result from the increasingly common practice of recruiting players from all over

the world.

Growth, which rarely continues beyond the age of 20, demands calories and nutrients — notably, protein — to feed expanding tissues. At the start of the 20th century, under-nutrition and childhood infections got in the way. But as diet and health improved, children and adolescents have, on average, increased in height by about an inch and a half every 20 years, a pattern known as the secular trend in height. Yet according to the Centers for Disease Control and Prevention, average height — 5'9" for men, 5'4" for women — hasn't really changed since 1960.

[Genetically speaking, there are advantages to avoiding substantial height.]

During childbirth, larger babies have more difficulty passing through the birth canal. Moreover, even though humans have been upright for millions of years, our feet and back continue to struggle with bipedal posture and cannot easily withstand repeated strain imposed by oversized limbs. "There are some real constraints that are set by the genetic architecture of the individual organism," says anthropologist William Leonard of Northwestern University.
